1

WHAT IS CLAIMED IS:

1.

2	a brush head assembly;
3	a housing;
4	a frame enclosed by the housing;
5	a power supply contained within the housing;
6	an electric coil and core that is secured relative to the frame and
7	electrically connected to the power supply through a control circuit that creates an
8	alternating flow of current in the coil;
9	an elongated driveshaft having a distal end that is connected to the
10	brush head assembly and an internal end that is disposed within the housing;
11	a torsion bar is secured to the frame at a first end;
12	an armature having first and second ends, the armature is connected
13	to one of the torsion bar or the driveshaft;
14	at least one magnet arranged on the armature, the magnet being
15	aligned relative to a central axis of the driveshaft, the magnet being located at a
16	radially spaced location relative to the central axis of the shaft, wherein the
17	alternating flow of current in the electric coil at a predetermined frequency causes
18	the first and second ends of the armature to be alternately attracted to the coil and
19	core causing the torsion bar to twist and causing the driveshaft to oscillate in an
20	oscillatory rotary motion.
1	2. The electric toothbrush of claim 1 wherein the frame is a one
2	piece die casting to which the coil, torsion bar and a bearing that journals the
3	internal end of the driveshaft are secured.
1	3. The electric toothbrush of claim 1 wherein the torsion bar is
2	clamped by an anchoring plate to the frame at the first end.
1	4. The electric toothbrush of claim 1 wherein a bearing journals
2	the internal end of the elongated shaft for oscillating rotary movement and inhibits
3	translational movement.

An electric toothbrush comprising:

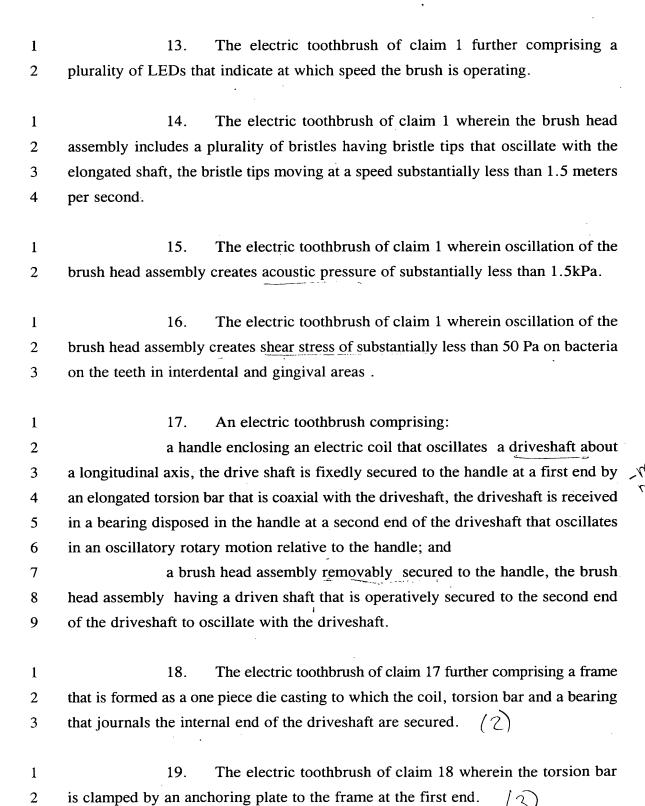

2

3

operational speeds.

1	5. The electric toothbrush of claim 1 wherein the brush head
2	assembly has a driven shaft that is detachable from the driveshaft.
1	6. The electric toothbrush of claim 5 wherein the brush head
2	assembly may be detached from the driveshaft without opening the housing and
3	without effecting the coil and magnets.
1	7. The electric toothbrush of claim 1 wherein said at least one
2	magnet arranged on the armature includes a first magnet and a second magnet, and
3	wherein the torsion bar is secured to the armature between the first and second
4	magnets and the driveshaft is connected at the internal end thereof to the armature.
1	8. The electric toothbrush of claim 1 wherein the coil is
2	connected to a E-shaped coil armature.
1	9. The electric toothbrush of claim 1 wherein said at least one
2	magnet arranged on the armature includes a first magnet and the armature
3	supporting the first and second magnets on a flat plate portion on which the first and
4	second magnets are disposed and a flange extending perpendicularly relative to the
5	flat plate portion, wherein the driveshaft is secured to the flange.
1	10. The electric toothbrush of claim 1 further comprising a
2	charging coil contained within the housing for recharging the power supply
3	contained in the housing.
. 1	11. The electric toothbrush of claim 10 in combination with a
2	charging base, wherein a charging circuit is provided to charge the power supply,
3	and wherein placing the electric toothbrush in the base ends an operating cycle.
1	12. The electric toothbrush of claim 1 further comprising a single

control switch that may be pressed multiple times to select one of a plurality of

1	20. The electric toothbrush of claim 17 wherein a bearing journal
2	the internal end of the elongated shaft for oscillating rotary movement and inhibit
3	translational movement. (U)
1	21. The electric toothbrush of claim 17 wherein the brush head
2	assembly has a driven shaft that is detachable from the driveshaft. (5)
1	22. The electric toothbrush of claim 17 wherein the brush head
2	assembly may be detached from the driveshaft without opening the housing and
3	without effecting the coil, core, and magnets. (\sim
1	23. The electric toothbrush of claim 17 further comprising
2	torsion bar that is secured to an armature between a first magnet and a second
3	magnet and the driveshaft is connected at an internal end thereof to the armature.
1	24. The electric toothbrush of claim 17 wherein the coil i
2	connected to an E-shaped coil armature.
1	25. The electric toothbrush of claim 17 further comprising a
2	armature supporting the first and second magnets, the armature having a flat plat
3	portion on which the first and second magnets are secured and a flange extending
4	perpendicularly relative to the flat plate portion, wherein the driveshaft is secure
5	to the flange.
1	26. The electric toothbrush of claim 17 further comprising
2	charging coil contained within the housing for recharging the batteries contained in
3	the housing.
1	27. The electric toothbrush of claim 26 in combination with
2	charging base, wherein a charging circuit is provided to charge the batteries, and

wherein placing the electric toothbrush in the base ends an operating cycle.

1	28. The electric toothbrush of claim 17 further comprising a single
2	control switch that may be pressed multiple times to select one of a plurality of
3	operational speeds.
1	29. The electric toothbrush of claim 17 further comprising a
2	plurality of LEDs that indicate the speed at which the brush is operating.
1	30. The electric toothbrush of claim 17 wherein the brush head
2	assembly includes a plurality of bristles having bristle tips that oscillate with the
3	elongated shaft, the bristle tips moving at less than 1.4 meters per second.
1	31. The electric toothbrush of claim 17 wherein oscillation of the
2	brush head assembly creates acoustic pressure of substantially less than 1.5kPa.
1	32. The electric toothbrush of claim 17 wherein oscillation of the
2	brush head assembly creates shear stress of substantially less than 50 Pa on bacteria
3	on the teeth in interdental and gingival areas.
1	33. An electric toothbrush comprising:
2	a brush head assembly;
3	a housing;
4	a frame enclosed by the housing;
5	a power supply contained within the housing;
6	an electric coil fixedly mounted relative to the frame and electrically
7	connected to the power supply through a control circuit that creates an alternating
8	flow of current in the coil;
9	an elongated driveshaft/torsion bar having a distal end that is
10	connected to the brush head assembly and an internal end that is secured to the
11	frame at an inner end;
12	an armature connected to an intermediate portion of the
13	driveshaft/torsion bar; and
14	at least one magnet arranged on the armature having first and second
15	ends, the magnet being aligned relative to a central axis of the driveshaft/torsion

16	bar, the magnet being located at radially spaced location relative to the central axis,
17	wherein the alternating flow of current in the electric coil at a predetermined
18	frequency causes the first and second ends of the armature to be alternately attracted
19	to the coil and core causing the driveshaft/torsion bar to oscillate in an oscillatory
20	rotary motion.

34. A removable brush head assembly and electric toothbrush body, in combination, comprising:

a brush head;

a plurality of bristles molded into the brush head;

an elongated brush head body having an attachment end and a brush

6 head end;

15

16 17 a driven shaft extending longitudinally through the brush head body, the driven shaft having a distal end embedded in the brush head;

a driven shaft holder receiving the driven shaft with the distal end extending outwardly from the driven shaft holder, the driven shaft holder being received in the brush head body, wherein the driven shaft drives the brush head to oscillate in an oscillatory rotary motion relative to the driveshaft holder and brush head body; and

the attachment end of the brush head body having a first locking element and the toothbrush body having a second locking element that cooperates with the first locking element to detachably retain the brush head body on the toothbrush body.
